13 Final Week 5 Takeaways	13

1 Week 5 Map and Source Order

Week 5 is the transition from planning to manuscript drafting. Week 4 produced a synthesis matrix, theme development, and organizational outline. Week 5 asks the writer to use that work to draft a cohesive literature review manuscript, strengthen academic voice, integrate sources strategically, and use peer feedback for revision.

The saved Week 5 materials should be read in this order:

1. **Week 5 overview page.** Introduces the module, learning objectives, weekly tasks, due dates, and Assignment 9 and 10 summaries.
2. **Where Synthesis Appears in Literature Reviews.** Explains where synthesis is strongest and how synthesis differs across review methodologies.
3. **Writing from Your Initial Outline.** Shows how to turn Week 4 outline bullets into synthesized paragraphs and linked sections.
4. **Integrating Sources and Scholarly Voice.** Refines academic voice, citation grouping, source integration, genre awareness, and paragraph-level polish.
5. **Writing the Full Literature Review Manuscript.** Gives section-by-section drafting guidance for introduction, methods, discussion/implications, limitations, and conclusion across review types.
6. **Peer Review and Revision.** Explains how to give and use feedback through a reader-focused process.
7. **Peer Review in Practice.** Discussion activity requiring draft sharing, peer responses, and a revision plan.
8. **Assignments 9 and 10.** Writing Lab Appointment 2 and Draft Literature Review Paper, both due Sunday, June 21, 2026 at 11:59 PM Eastern.
9. **External reading.** Rana, Singh, and Kathuria's POWER framework reading on writing effective literature review papers.

The central Week 5 shift is from: *I have a matrix and outline to I can write a manuscript section that makes a clear claim, combines sources, interprets patterns, and prepares for feedback.*

2 Module Overview

2.1 Theme

The Week 5 module is titled **Drafting the Manuscript**. It focuses on moving from source organization into a substantial literature review draft. The draft should demonstrate synthesis across studies, include methodology-informed structure, and show meaningful progress toward a complete manuscript. Peer feedback and revision are not add-ons; they are central to the week.

2.2 Learning Objectives

By the end of Week 5, students should be able to:

- develop a substantial draft of a literature review manuscript;
- integrate research across sources rather than summarize individual studies;
- organize the manuscript with clear headings, subheadings, and a full outline;
- establish a focused introduction that communicates topic, purpose, and direction;
- identify patterns, themes, and tensions across studies;
- incorporate methodology decisions into developing sections;
- provide and apply peer feedback;
- revise in response to peer and writing-support feedback.

2.3 Weekly To-Do List

Item	Purpose
Where Synthesis Appears in Literature Reviews	Locate where synthesis belongs in a manuscript and how it differs by review type.
Writing from Your Initial Outline	Convert Week 4 outline points into synthesized paragraphs and linked sections.
Integrating Sources and Scholarly Voice	Polish paragraphs through academic voice, citation strategy, sentence flow, and genre awareness.
Writing the Full Literature Review Manuscript	Draft the manuscript sections: introduction, methods, body, discussion, limitations, and conclusion.
Reading: POWER framework	Understand parameters and decision elements for effective literature review papers.
Peer Review and Revision	Prepare to give and use structured peer feedback.
Discussion: Peer Review in Practice	Post a draft, review peers' drafts, and identify one revision after feedback.
Assignment 9 and Assignment 10	Complete Writing Lab Appointment 2 and submit the draft literature review paper.

3 Where Synthesis Appears in a Literature Review

3.1 Main Principle

Synthesis does not appear equally in every section of a literature review. It is strongest where studies are discussed together and where the writer explains patterns, relationships, differences, or gaps across the literature. A methods section may describe search strategy and selection criteria with minimal synthesis, while body and discussion sections should make synthesis visible.

3.2 Synthesis by Section

Section or writing type	What it does	Synthesis level	What writing should look like
Introduction and conclusion	Introduce topic, summarize key ideas, and frame the contribution.	Moderate	Briefly combine research to establish context and overall trends.
Main body sections	Present the literature using outline themes, categories, variables, findings, or conceptual sections.	High	Combine multiple studies, compare findings, and explain relationships.
Discussion or interpretation	Explain what the mapped patterns mean and why they matter.	Highest	Interpret findings, connect sections, identify gaps, and explain significance.
Evidence displays	Present study characteristics, variables, mapped data, or matrix results.	Low	Organize information; do not make tables do all of the interpretive work.
Methodology/process description	Explain how the review was conducted.	Minimal	Describe search strategy, screening, selection, and analysis process.

The practical rule is simple: tables organize evidence, methods explain process, body paragraphs synthesize evidence, and the discussion interprets the significance of the synthesis.

3.3 Synthesis by Review Type

Narrative, integrative, and theoretical/conceptual reviews use synthesis to interpret ideas, themes, relationships, concepts, frameworks, or debates. Scoping reviews use synthesis to map categories, trends, distributions, and gaps. Systematic reviews often report structured findings first, then compare and interpret patterns.

For the user's current scoping-review topic, the strongest synthesis should emphasize how research is distributed across VLM architectures, data modalities, construction tasks, evaluation metrics, safety/progress applications, and under-developed gaps. It should not claim to determine which intervention is most effective unless the evidence and review design support that claim.

4 Writing from the Initial Outline

4.1 From Outline to Paragraph

The Week 4 outline becomes the Week 5 draft by turning each outline section into paragraphs that combine studies around a claim. The process is:

1. Start with a section heading that names the section's main idea.
2. Turn the heading into a topic sentence or claim.
3. Group 2-4 related studies from the matrix or source notes.
4. Combine studies in sentences rather than listing one study at a time.
5. Add comparison, contrast, agreement, variability, or tension.
6. Interpret what the pattern means.
7. End the paragraph or section with a takeaway.

The difference between weak and strong writing is not citation count. Weak writing says, study A found this, study B found this, study C found this. Strong writing says, across these studies, a pattern appears; however, the pattern changes under certain conditions; therefore, the literature suggests a specific interpretation or gap.

4.2 Basic and Deeper Synthesis

Basic synthesis combines studies. Deeper synthesis explains what the studies show together. The lesson recommends adding at least one of the following moves:

- **Pattern statement:** what consistently appears across studies.
- **Tension or contrast:** where findings differ, conflict, or emphasize different dimensions.
- **Condition:** when, why, or for whom results change.
- **Implication:** what the pattern means for the topic, field, method, or practice.

For example, a basic scoping-review sentence might state that VLM studies address safety inspection and progress reporting. A deeper version would explain that safety studies often move toward contextual hazard interpretation, while progress studies expose temporal-reasoning gaps; together, this pattern suggests that construction VLM research is expanding from object recognition toward task-specific decision support, but unevenly across applications.

4.3 Connecting Paragraphs and Sections

Strong literature reviews do not restart with every paragraph. Each paragraph should extend, shift, contrast, or refine the previous one. The course suggests using transitions such as:

- across studies, researchers consistently find;
- however, findings differ across contexts;
- in contrast to earlier research;
- building on previous findings;
- this extends earlier work by.

Before adding a new paragraph, ask what the previous paragraph did and what the next paragraph must add. A paragraph can show a pattern, add a condition, introduce a contrast, explain a limitation, or move from one theme to another. The connection should be explicit, not assumed.

5 Integrating Sources and Scholarly Voice

5.1 Academic Voice

Week 5 defines academic voice as a formal, clear, evidence-based style of presenting ideas. Academic voice is not complicated vocabulary. It is the writer's decision to make clear claims, use careful language, support those claims with evidence, and foreground patterns rather than conversation or personal opinion.

Academic voice should be:

- clear and concise;
- focused on ideas, patterns, and meaning;
- objective and evidence-based;
- confident but appropriately cautious;
- led by the writer's interpretation, with sources supporting the claim.

Preferred verbs and stance markers include *suggests*, *indicates*, *highlights*, *demonstrates*, and *points to*. Avoid unsupported certainty such as *proves* unless the evidence actually warrants it.

5.2 Genre Awareness

A literature review is a specific academic genre. It has different expectations from a discussion post, research article report, or annotated bibliography. Genre analysis asks how a text works: how ideas are organized, how sources are used, how the writer addresses an audience, how cautious or confident the voice is, and how much detail is needed.

For literature reviews, the genre expectation is to:

- focus on patterns across studies rather than individual sources;
- use multiple sources within sentences when they support the same point;
- develop connections and relationships among ideas;
- interpret what the research means;
- keep the writer's argument visible.

5.3 Citation Strategy

Academic voice and citation work together. The writer makes a claim, supports it with grouped evidence, and then interprets the meaning. Citation strategy should:

- group studies that support the same idea;
- avoid repeating separate citations for every sentence when one grouped citation supports the pattern;
- place citations where they support the claim;
- avoid author-by-author listing when the goal is synthesis;
- use comparison and qualification when studies differ.

The course's repeated revision principle is: emphasize the idea first, then use citations as support. A choppy paragraph lists authors. A polished paragraph blends sources into a claim, adds nuance, and interprets the pattern.

5.4 Paragraph Revision Checklist

Revision target	Question to ask
Sentence structure	Do too many sentences begin with the same phrase or author name?
Source integration	Are studies combined around ideas rather than listed separately?
Scholarly voice	Does the paragraph sound evidence-based and confident without being inflated?
Citation placement	Are citations grouped strategically and not repeated mechanically?
Comparison	Does the paragraph show agreement, contrast, condition, or variability?
Interpretation	Does the writer explain what the pattern means?
Takeaway	Does the paragraph end with a clear contribution to the section's argument?

6 Drafting the Full Literature Review Manuscript

6.1 Required Manuscript Parts

The full manuscript draft should include:

- introduction;
- methods section aligned with the literature review methodology;
- body sections developed from synthesized outline sections;
- discussion or implications;
- limitations;
- conclusion.

Some results, discussion, implications, or limitation sections may still be developing. The assignment is a draft, not a final paper. A strong draft is developed enough to support meaningful feedback and revision.

6.2 Introduction

The introduction tells readers what the topic is, why it matters, and what the review will do. The lesson gives a four-part structure:

1. **Topic context:** explain the broad topic.
2. **What is known:** synthesize what has already been studied.
3. **Gap or problem:** explain what is missing, unclear, fragmented, inconsistent, or under-mapped.
4. **Purpose:** state what the review will do and what it contributes.

Different review types shape the introduction differently:

Review type	Introduction emphasis
Narrative	Frame the topic broadly, explain key perspectives or debates, and build a coherent interpretive direction.
Theoretical / conceptual	Establish why a concept or framework needs clarification, comparison, extension, or refinement.
Integrative	Show why diverse empirical, theoretical, or conceptual evidence needs to be brought together.

Review type	Introduction emphasis
Scoping	Establish a broad and/or emerging topic, show that the scope is unclear, and justify mapping trends and gaps.
Systematic	Define a focused problem, summarize known findings, identify inconsistency or missing comparison, and state a clear question.

For the user's scoping review, the introduction should emphasize rapid growth of VLM and multimodal AI work in construction, the diversity of safety/progress tasks and technical approaches, and the need to map rather than evaluate a single intervention.

6.3 Methods

The methods section explains how sources were identified, selected, and analyzed. It should cover:

- where sources came from: databases, search engines, snowballing, or other search strategies;
- how inclusion and exclusion decisions were made;
- how sources were organized, coded, charted, compared, or synthesized.

The lesson gives a simple structure: search strategy, selection criteria, and analysis approach. For scoping reviews, the methods section should explain broad search terms, relevance-based inclusion, source types included, grouping/categorization approach, and focus on trends, gaps, and patterns. It can reference PRISMA-style structure if appropriate.

6.4 Methods Paragraph Builder

Week 5 also points students back to their working document. The Methods Paragraph Builder activity asks students to add scaffold sheets to the existing workbook and use earlier search logs, screening decisions, source notes, and synthesis planning.

The scaffold should collect:

- review methodology;
- search sources or databases;
- search terms;
- inclusion and exclusion criteria;
- source types;
- reasons for including sources;
- notes that help describe the process.

The paragraph builder then uses blue input cells for review type, topic/focus, databases/search sources, search terms, time span, extra search strategies, criteria, screening process, organization/analysis approach, and the purpose of the methods choice. The generated paragraph is only a starting point; it must be revised to match the actual topic, method, tone, and manuscript structure.

6.5 Body Sections

The body is where synthesized outline sections become the substance of the literature review. Body sections should:

- be organized by theme, category, variable, methodology, chronology, theory, or finding depending on review type;
- begin with claims rather than source names;
- integrate multiple sources within paragraphs;
- compare agreement, difference, contradiction, and condition;
- include interpretation after evidence;
- connect across paragraphs and sections.

For the user's VLM scoping review, a strong body structure can continue the Week 4 themes: detection to semantic multimodal reasoning; safety compliance and contextual hazard interpretation; activity tracking and temporal reasoning; and dataset, benchmark, and deployment limitations.

6.6 Discussion and Implications

The discussion/implications section moves beyond describing the literature to explaining what the literature means. It should:

- interpret the literature as a whole;
- explain patterns, relationships, or themes;
- connect studies that support, contradict, or extend each other;
- identify implications for practice, research, or theory;
- name gaps and future directions.

It should not summarize individual articles, repeat earlier sections, or be organized by source. The key move is from *Study 1 says; Study 2 says* to *Across studies, the literature shows*.

Review type	Discussion emphasis
Narrative	Interpret ideas and perspectives; explain how viewpoints relate or contrast.
Theoretical / conceptual	Clarify, connect, refine, or extend concepts and frameworks.
Integrative	Synthesize diverse findings to identify patterns and relationships.
Scoping	Describe trends, distribution, categories, and gaps rather than effectiveness.
Systematic	Evaluate strength, consistency, and implications of evidence.

6.7 Limitations

The limitations section identifies boundaries and constraints of the review. It should not sound like a confession of failure. It demonstrates professional judgment about what the review can and cannot claim.

The lesson's limitation categories are:

- scope limitations: what was included or excluded;
- evidence constraints: limitations in available studies;
- methodological boundaries: what the method allows or does not allow;
- impact on interpretation: how limitations shape conclusions;
- future research: what should happen next.

For scoping reviews, a typical limitation is that mapping breadth does not evaluate effectiveness or study quality in the same way a systematic review might. Broad inclusion also increases variation in study design, context, and depth, which limits narrow comparison.

6.8 Conclusion

The conclusion closes the review by summarizing key insights and reinforcing the review's contribution. It should:

- summarize the most important patterns;
- connect back to the purpose or research question;
- state what the review contributes;
- explain why the findings matter;

- point forward briefly.

It should not introduce new evidence, new themes, or a second discussion section. Useful openings include: *Overall, the literature shows*; *Taken together, these findings suggest*; *This review contributes by*; and *These insights highlight*.

7 Methodology-Specific Drafting Guide

Review type	Introduction	Methods	Discussion / conclusion
Narrative	Broad topic, key perspectives, debate, coherent narrative.	Targeted searches, influential sources, interpretive synthesis.	Interpret perspectives; explain how viewpoints relate.
Theoretical / conceptual	Concept or framework needs clarification, comparison, or extension.	Conceptual relevance, foundational authors, framework comparison.	Clarify concepts or extend frameworks; identify theoretical contribution.
Integrative	Diverse evidence needs integration across disciplines, methods, or perspectives.	Multiple evidence types; relevance across designs; comparison and synthesis.	Identify broader patterns and relationships across diverse evidence.
Scoping	Emerging or broad field; scope and direction are unclear.	Broad search, relevance-based inclusion, categorization, mapping of trends and gaps.	Describe distributions, concentrations, gaps, and future research directions.
Systematic	Focused problem, known findings, inconsistency, clear question.	Structured search, explicit criteria, screening process, extracted outcomes.	Evaluate strength and consistency of evidence; discuss implications and limits.

8 Peer Review and Revision

8.1 Purpose of Peer Review

Peer review is a reader-focused process. It is not primarily about fixing grammar, grading a peer, or rewriting someone else's paper. Its purpose is to help a writer understand how the draft is being interpreted and what revisions would strengthen argument, synthesis, and organization.

8.2 Reviewer Process

The course recommends a structured process:

1. Read the entire draft before commenting.
2. Focus first on higher-order concerns: argument clarity, synthesis, organization, and section logic.
3. Provide balanced feedback: at least one strength, one question, and one specific suggestion.
4. Address sentence-level concerns only after meaning and structure.

The key principle is: prioritize meaning before mechanics.

8.3 Praise, Question, Suggest

The Week 5 framework for feedback is:

- **Praise:** identify what is working.
- **Question:** ask about unclear, underdeveloped, or confusing areas.
- **Suggest:** offer a specific revision path.

Weak feedback says: *This is unclear* or *Looks good*. Strong feedback says: *This paragraph cites several studies but does not explain how they connect; could you synthesize the findings to show the pattern?*

8.4 Receiving Feedback

When receiving feedback:

1. Pause before reacting.
2. Look for patterns across comments.
3. Group similar feedback.
4. Prioritize higher-order concerns.
5. Turn comments into revision tasks.
6. Remember that the writer remains the author and does not need to accept every suggestion.

Revision is not just editing. It may involve re-envisioning the argument, reorganizing sections, improving transitions, and strengthening synthesis.

9 Peer Review in Practice Discussion

9.1 Discussion Requirements

The discussion is due Thursday, June 18, 2026 at 11:59 PM. Students work in small groups.

Initial post requirements:

- post the draft paper in Word document format;
- remind peers which methodology is being used;
- identify successes and challenges;
- identify areas where feedback is desired, such as organization;
- respond to feedback received on Saturday by identifying one key planned revision.

Peer response requirements:

- review two peers' drafts fully before commenting;
- provide at least one strength;
- ask at least one question;
- offer at least two specific suggestions for improvement;
- optionally share helpful resources;
- focus on higher-order concerns such as argument, synthesis, and organization.

The discussion emphasizes professional tone, specificity, actionable feedback, and questions that prompt deeper thinking.

9.2 Examples Visible in the Discussion Page

The saved discussion page shows draft-sharing examples from peers:

- A scoping review on preservice teacher education for refugee and displacement-affected learning environments, with feedback requested on organization and clarity of synthesis.
- A scoping review on signal-vehicle cooperative control at signalized intersections, with feedback requested on synthesis, theme clarity, and technical explanation for readers outside transportation engineering.

- A narrative/thematic review on perceived reasoning in conversational AI virtual agents in VR, with feedback requested on synthesis, transitions, concise academic writing, and the clarity of the argument.

These examples reinforce the Week 5 pattern: students are expected to name their methodology, identify the draft's current strengths, state challenges honestly, and ask for targeted feedback.

10 Assignments

10.1 Assignment 9: Writing Lab Appointment 2

Assignment 9 is due Sunday, June 21, 2026 at 11:59 PM Eastern. Students must attend a second synchronous Purdue Writing Lab appointment, either in person or online. The purpose is to become comfortable sharing writing and using feedback to improve writing.

Required evidence:

- the Writing Lab coach report;
- a student reflection;
- completion during the week before submission.

The Week 5 page links to full instructions in an external Google Doc titled *Writing Lab Appointment*. The saved local page includes the assignment summary but not the full Google Doc contents.

10.2 Assignment 10: Draft Literature Review Paper

Assignment 10 is due Sunday, June 21, 2026 at 11:59 PM Eastern. It asks for a substantial draft literature review manuscript that moves from planning to writing.

The draft should include:

- a full manuscript outline with expected sections represented;
- a clearly developed introduction;
- a literature review body that synthesizes research rather than summarizes sources;
- clear organization with headings and subheadings;
- evidence of connections across studies, including patterns, themes, or tensions;
- methodology-related sections or content included or in development;
- optional results, discussion, implications, or limitations if developed.

The required submission is a Word document. The file naming instruction is:

Draft Literature Review Plan_SemYR_Your LastName_Your FirstName

The Week 5 page links to a full external Google Doc titled *Draft Literature Review Paper* for complete instructions and grading rubric. The saved local page includes the assignment overview, submission requirement, and link, but not the full rubric text.

11 POWER Framework Reading

The Week 5 reading is *Parameters and Decision Elements of Writing Effective Literature Review Papers: Empirical Evidence from Multiple Stakeholders on POWER Framework* by Rana, Singh, and Kathuria. Public metadata identifies it as a 2023 chapter/article in *Review of Management Literature*, volume 2, pages 1-25, with DOI <https://doi.org/10.1108/S2754-586520230000002001>.

The POWER framework organizes quality literature review writing around five parameters:

1. **Planning:** defining purpose, scope, review type, audience, and contribution before writing.
2. **Operationalizing:** making the review process transparent through search, selection, coding, analysis, and methodological decisions.

3. **Writing:** turning evidence into a coherent scholarly manuscript with clear structure and voice.
4. **Embedding:** presenting the results and contribution that emerge from the review so they are meaningful to the field.
5. **Reflecting:** checking the review's quality, fit, limitations, and value for readers, reviewers, and editors.

The public abstract reports that the authors refined 256 responses from writers, reviewers, and editors into 37 decision elements. It also notes high priority for embedding and operationalizing, while planning, writing, and reflecting remain important. This aligns closely with Week 5: students are no longer only collecting sources; they are operationalizing their process, writing a coherent manuscript, embedding a contribution, and preparing to revise through feedback.

12 Applied Notes for the Current VLM Scoping Review

For the user's literature review on VLMs and multimodal AI for construction safety and progress monitoring, Week 5 translates directly into the following manuscript moves:

1. **Introduction:** define construction-site monitoring, VLMs, multimodal AI, safety/progress applications, and spatiotemporal reasoning; then show why the field needs mapping.
2. **Methods:** describe databases, search strings, inclusion/exclusion criteria, PRISMA-ScR alignment, backward snowballing, and charting variables.
3. **Body:** organize by themes from Week 4: detection to semantic reasoning; safety compliance and contextual hazards; progress tracking and temporal reasoning; dataset, benchmark, and deployment limits.
4. **Discussion:** interpret the mapped patterns: the field is moving toward interactive, context-aware, domain-guided VLM systems but remains limited by data, temporal reasoning, benchmarks, prompt reliability, and real-site validation.
5. **Limitations:** state that a scoping review maps evidence rather than evaluating effectiveness; acknowledge heterogeneity in study design, metrics, and technology maturity.
6. **Conclusion:** summarize the field's direction and identify future research needs such as construction-specific benchmarks, stronger temporal datasets, and transparent field validation.

13 Final Week 5 Takeaways

1. Week 5 turns the Week 4 outline into manuscript prose.
2. Synthesis is strongest in body and discussion sections, not in methods.
3. Strong paragraphs begin with claims, group studies, compare patterns, and interpret meaning.
4. Scholarly voice means clear, evidence-based, idea-focused writing; it does not mean complicated wording.
5. Citations should be grouped strategically when sources support the same claim.
6. The full draft needs introduction, methods, synthesized body sections, discussion/implications, limitations, and conclusion, even if some sections are still developing.
7. Peer review should focus first on argument, synthesis, and organization.
8. Revision means rethinking structure and meaning, not just editing sentences.
9. Assignment 9 and Assignment 10 are both due Sunday, June 21, 2026 at 11:59 PM Eastern.
10. The POWER framework supports the same logic: plan, operationalize, write, embed contribution, and reflect through revision.
